CHAPTER 1 - Business Foundation

1. Executive Summary

The Project Velox Decision Intelligence Platform is a comprehensive Business Intelligence solution developed for a fictional multi-city food delivery company operating across India. The platform has been designed to assist executive leadership and operational stakeholders in transforming raw business data into meaningful insights that support faster, data-driven decision-making.

The rapid growth of food delivery businesses introduces increasing operational complexity across multiple cities, restaurants, delivery partners, and customer segments. As business operations expand, organizations require more than traditional reporting systems that simply present historical metrics. They require an integrated platform capable of identifying operational bottlenecks, measuring organizational performance, monitoring customer behavior, and recommending corrective business actions before performance declines significantly.

The objective of this project is to design a centralized Decision Intelligence Platform that combines business understanding, relational database design, advanced SQL analytics, stakeholder-driven KPI engineering, and executive business intelligence reporting into a single analytical ecosystem.

Unlike conventional SQL portfolio projects that primarily focus on querying datasets, this platform adopts a business-first approach where every analytical component originates from a real business requirement. Every SQL query, KPI, dashboard visualization, and recommendation has been designed to support a specific stakeholder decision rather than demonstrating technical implementation alone.

The platform emphasizes weekly business reviews over traditional monthly reporting cycles, enabling management teams to proactively identify emerging operational issues, monitor organizational health, and implement timely corrective actions. Through contextual KPI measurement, operational alerts, and stakeholder-specific insights, the platform supports continuous improvement across delivery operations, customer experience, restaurant performance, financial monitoring, and strategic business planning.

The final deliverable is intended to simulate a professional analytics consulting engagement by integrating business architecture, SQL-based analytics, business intelligence dashboards, and executive decision support into a unified Decision Intelligence Platform.

2. Business Background

The food delivery industry has experienced rapid growth over the past decade, driven by increasing digital adoption, changing consumer lifestyles, and the growing demand for convenience. As food delivery platforms expand across multiple cities, managing daily operations becomes significantly more complex. Thousands of orders are processed every day through a network of restaurants, delivery partners, customers, and support teams, generating large volumes of operational and transactional data.

Although organizations collect vast amounts of business data, many continue to rely on static reports that primarily summarize historical performance. These reports often answer *what* happened but provide limited visibility into *why* performance changed, *who* is affected, and *what actions* should be taken to improve future outcomes.

Modern organizations require analytical platforms capable of transforming raw operational data into actionable business intelligence. Decision-makers need visibility into delivery efficiency, restaurant performance, customer satisfaction, rider productivity, financial performance, and operational risks through a centralized analytics platform.

This project simulates such an environment by designing an end-to-end Decision Intelligence Platform for a fictional multi-city food delivery company operating across India. The platform integrates business understanding, relational database design, SQL analytics, KPI engineering, and business intelligence reporting to support proactive decision-making across multiple business functions.

Unlike conventional analytical dashboards that focus solely on visualization, this platform emphasizes business context by linking operational performance to measurable business outcomes. Every analytical component within the platform is designed to support strategic and operational decision-making through meaningful insights and actionable recommendations.

3. Business Problem Statement

As the organization continues to expand across multiple cities, maintaining operational consistency becomes increasingly challenging. The growing scale of business operations introduces several interconnected problems affecting customers, restaurants, delivery partners, finance teams, and executive leadership.

Delivery delays caused by traffic congestion, adverse weather conditions, restaurant preparation inefficiencies, and rider allocation issues directly influence customer satisfaction and business performance. Similarly, inconsistent restaurant quality, increasing cancellation rates, rider fatigue, and declining customer loyalty create operational inefficiencies that negatively impact long-term growth.

Existing reporting approaches typically present isolated performance metrics without explaining the underlying business drivers. Management teams often receive fragmented information from different departments, making it difficult to identify cross-functional issues and prioritize corrective actions.

As a result, business decisions become reactive rather than proactive, with operational problems often identified only after they have significantly affected customer experience or financial performance.

The absence of an integrated analytical framework also limits the organization's ability to evaluate business performance from multiple stakeholder perspectives. Executive leadership requires consolidated business health indicators, operations teams require current operational performance visibility, marketing teams need customer retention insights, finance teams require revenue quality analysis, and restaurant success teams need performance benchmarking.

This project addresses these challenges by developing a centralized Decision Intelligence Platform capable of integrating operational, financial, and customer data into a unified analytical ecosystem that supports faster, data-driven decision-making.

4. Vision Statement

To develop a stakeholder-driven Decision Intelligence Platform that enables organizations to transform operational data into actionable business intelligence by providing contextual insights, intelligent KPI measurement, proactive operational alerts, and data-driven recommendations that support continuous business improvement.

The long-term vision of the platform is to bridge the gap between data analysis and business decision-making by ensuring that every analytical insight contributes directly to measurable operational improvements, enhanced customer experience, and sustainable organizational growth.

5. Business Objectives

The primary objective of this project is to design and develop a centralized Business Intelligence and Decision Intelligence Platform capable of supporting multiple organizational stakeholders through advanced SQL analytics and interactive reporting.

The platform aims to achieve the following business objectives:

Operational Excellence

Improve operational efficiency by identifying delivery bottlenecks, preparation delays, rider workload imbalances, and service-level agreement (SLA) violations before they significantly impact business performance.

Customer Experience Enhancement

Analyze customer behavior, satisfaction levels, complaint patterns, and loyalty trends to improve customer retention and long-term engagement.

Restaurant Performance Optimization

Evaluate restaurant operations using standardized performance indicators to identify high-performing partners, operational risks, and opportunities for service improvement.

Rider Productivity Improvement

Monitor rider performance while considering contextual factors such as traffic conditions, weather, delivery distance, and workload to improve operational efficiency without compromising rider well-being.

Financial Performance Monitoring

Provide meaningful financial insights by measuring revenue quality, cancellation impact, refund trends, and average order value rather than focusing solely on revenue generation.

Executive Decision Support

Deliver weekly business intelligence reports that enable executive leadership to identify organizational risks, evaluate business performance, and prioritize strategic initiatives through data-driven recommendations.

Data-Driven Organizational Culture

Promote evidence-based decision-making by ensuring every stakeholder has access to relevant KPIs, business insights, and actionable recommendations aligned with their operational responsibilities.

6. Project Scope

The scope of this project is limited to the design and implementation of a Business Intelligence and Decision Intelligence Platform for a fictional multi-city food delivery organization. The project focuses on transforming operational data into meaningful business insights through structured database design, SQL analytics, KPI engineering, and interactive reporting.

In Scope

- Design of a normalized relational database schema.
- Development of realistic business datasets representing operational activities.
- Definition of business rules governing customer, restaurant, rider, financial, and operational behavior.
- Development of stakeholder-specific Key Performance Indicators (KPIs).
- Advanced SQL analysis using Joins, Aggregations, Window Functions, Common Table Expressions (CTEs), Subqueries, and CASE expressions.
- Generation of weekly business insights and operational recommendations.
- Executive dashboard development using Power BI.
- Documentation including the Business Requirements Document (BRD), Analytics & KPI Specification (AKSD), Architecture Diagram, ER Diagram, Star Schema, Process Flowcharts, Data Dictionary, and technical implementation guides.

Out of Scope

- Real-time order tracking.
- Machine Learning and predictive analytics.
- Mobile application development.
- API integration with external systems.
- Cloud deployment and distributed databases.
- Live streaming data pipelines.
- Production-level authentication and security implementation.

7. Success Criteria

The Decision Intelligence Platform will be considered successful if it enables stakeholders to monitor organizational performance through meaningful, actionable, and business-focused analytics.

The platform shall be considered successful upon achieving the following outcomes:

- Successfully model a realistic multi-city food delivery business environment through a normalized relational database.
- Enable executive leadership to evaluate organizational performance using stakeholder-driven KPIs and consolidated business health indicators.
- Identify operational inefficiencies across restaurants, delivery zones, riders, and customer segments through advanced SQL analytics.
- Support weekly business reviews by generating meaningful insights and recommended corrective actions.
- Measure customer loyalty, restaurant performance, rider productivity, financial health, and operational efficiency using contextual business metrics.
- Provide stakeholder-specific dashboards capable of supporting strategic and operational decision-making.
- Demonstrate how SQL can be applied beyond query writing to solve realistic business problems and support organizational decision-making.
- Demonstrate a complete analytics lifecycle from business understanding and database design to SQL analysis, business intelligence reporting, and executive decision support.

Chapter 2 - Business Requirements

Chapter Overview

The Business Requirements chapter defines the functional expectations of the Decision Intelligence Platform by identifying the stakeholders who interact with the system, the information they require, the decisions they are expected to make, and the operational rules governing business activities.

Rather than treating analytics as a generic reporting function, the platform adopts a stakeholder-centric approach where each business unit receives tailored insights aligned with its operational responsibilities. This ensures that every analytical component developed throughout the project contributes directly to solving a real business problem.

The requirements documented within this chapter establish the foundation for database design, KPI engineering, SQL analysis, dashboard development, and executive decision support.

8. Stakeholder Analysis

8.1 Overview

The Decision Intelligence Platform is designed to support multiple business functions operating within a modern food delivery organization. Each stakeholder is responsible for a different aspect of business performance and therefore requires a unique set of analytical insights, key performance indicators (KPIs), and operational recommendations. Instead of presenting identical dashboards to every user, the platform delivers stakeholder-specific analytics that enable each department to monitor its own objectives while contributing to the organization's overall performance.

The platform currently supports the following primary stakeholder groups:

- Executive Leadership
- Operations Management
- Restaurant Success Team
- Marketing Team
- Finance Team
- Customer Experience Team

Although each stakeholder operates independently, business performance is measured collectively through integrated KPIs and cross-functional business insights.

8.2 Chief Executive Officer (CEO)

Business Role

The Chief Executive Officer is responsible for monitoring the overall health, growth, and long-term strategic direction of the organization. Rather than focusing on daily operational activities, executive leadership requires high-level business intelligence that summarizes organizational performance and highlights areas requiring strategic intervention.

Primary Responsibilities

- Monitor overall organizational performance.
 - Track business growth across multiple cities.
 - Evaluate long-term operational health.
 - Approve strategic investments.
 - Allocate organizational resources.
 - Review weekly executive performance reports.
-

Primary KPIs

- Executive Health Index (EHI)
 - Operational Health Score (OHS)
 - Customer Loyalty Score (CLS)
 - Growth Momentum Index (GMI)
 - Revenue Quality Score (RQS)
-

Key Business Questions

- Which cities contribute the highest overall business value?
 - Is organizational performance improving compared to the previous week?
 - Which operational issues require immediate executive attention?
 - Which business functions are limiting future growth?
 - Which cities demonstrate the strongest long-term expansion potential?
-

Decisions Supported

- Expansion planning
 - Budget allocation
 - Strategic investment
 - Business prioritization
 - Executive performance monitoring
-

Primary Weekly Deliverables

- Weekly Executive Business Summary
 - Executive Health Index Report
 - Organizational Performance Scorecard
 - Critical Business Alerts
 - City Performance Ranking
 - Growth Momentum Report
 - Strategic Recommendations Report
-

Dashboard View

The CEO dashboard provides a high-level weekly overview of organizational performance through consolidated KPIs, executive alerts, strategic recommendations, and business health indicators.

8.3 Operations Manager

Business Role

The Operations Manager is responsible for ensuring smooth day-to-day delivery operations while maintaining service quality, operational efficiency, and SLA compliance across all delivery zones.

Primary Responsibilities

- Monitor delivery performance.
 - Optimize rider allocation.
 - Improve delivery efficiency.
 - Reduce operational delays.
 - Maintain service-level agreements.
 - Identify operational bottlenecks.
-

Primary KPIs

- Operational Health Score (OHS)
 - Rider Efficiency Score (RES)
 - Rider Fatigue Index (RFI)
 - Zone Stability Index (ZSI)
 - Average Delivery Time
 - On-Time Delivery Percentage
-

Key Business Questions

- Which delivery zones require immediate operational intervention?
 - Which restaurants consistently delay order preparation?
 - Which riders are operating beyond healthy workload limits?
 - How do weather and traffic affect delivery performance?
 - Which operational bottlenecks contribute most to delivery delays?
-

Decisions Supported

- Rider redistribution
 - Shift planning
 - Staffing optimization
 - Delivery zone optimization
 - Restaurant escalation
-

Primary Weekly Deliverables

- Weekly Operations Performance Report
 - SLA Compliance Report
 - Delivery Delay Analysis
 - Rider Utilization Report
 - Zone Stability Report
 - Operational Bottleneck Analysis
 - Corrective Action Plan
-

Dashboard View

The Operations dashboard focuses on weekly operational health, delay analysis, rider workload, delivery efficiency, SLA compliance, and operational alerts.

8.4 Restaurant Success Team

Business Role

The Restaurant Success Team manages restaurant partnerships by monitoring operational performance, identifying improvement opportunities, and ensuring consistent service quality across all partner restaurants.

Primary Responsibilities

- Monitor restaurant performance.
 - Improve operational efficiency.
 - Evaluate restaurant partnerships.
 - Reduce preparation delays.
 - Improve customer satisfaction.
-

Primary KPIs

- Restaurant Performance Score (RPS)
 - Average Preparation Time
 - Restaurant Rating
 - Order Completion Rate
 - Cancellation Rate
-

Key Business Questions

- Which restaurants consistently outperform their peers?
 - Which restaurants require operational support?
 - Which cuisine categories generate the highest customer satisfaction?
 - Which restaurant partnerships should be expanded?
 - Which restaurants are declining in performance over time?
-

Decisions Supported

- Restaurant benchmarking
 - Partner evaluation
 - Premium partner selection
 - Restaurant performance improvement
 - Operational recommendations
-

Primary Weekly Deliverables

- Restaurant Performance Report
 - Restaurant Ranking Report
 - Preparation Time Analysis
 - Restaurant Benchmarking Report
 - Cuisine Performance Report
 - Restaurant Improvement Recommendations
-

Dashboard View

The Restaurant dashboard highlights preparation efficiency, restaurant rankings, customer ratings, cuisine performance, and operational recommendations.

8.5 Marketing Team

Business Role

The Marketing Team focuses on customer acquisition, retention, campaign performance, loyalty growth, and customer engagement by analyzing purchasing behavior and promotional effectiveness.

Primary Responsibilities

- Improve customer retention.
 - Increase repeat purchases.
 - Evaluate campaign performance.
 - Optimize coupon strategies.
 - Grow Prime membership.
-

Primary KPIs

- Customer Loyalty Score (CLS)
 - Customer Recovery Rate (CRR)
 - Campaign Performance
 - Coupon Effectiveness
 - Prime Membership Growth
-

Key Business Questions

- Which campaigns generate the highest repeat purchase rate?
 - Which customer segments demonstrate the strongest loyalty?
 - Which promotional offers create long-term customer value?
 - Which customers are at risk of churn?
 - How effective are customer recovery initiatives?
-

Decisions Supported

- Campaign optimization
- Customer segmentation
- Promotional budgeting
- Loyalty program improvements
- Customer retention strategy

Primary Weekly Deliverables

- Customer Loyalty Report
- Campaign Performance Analysis
- Coupon Effectiveness Report
- Customer Segmentation Summary
- Prime Membership Growth Report
- Customer Recovery Report

Dashboard View

The Marketing dashboard presents customer loyalty trends, campaign effectiveness, coupon analysis, Prime membership growth, and customer recovery insights.

8.6 Finance Team

Business Role

The Finance Team is responsible for monitoring the organization's financial performance, ensuring sustainable revenue growth, evaluating operational profitability, and identifying financial risks associated with cancellations, refunds, discounts, and operational inefficiencies. The team focuses on understanding not only how much revenue the business generates, but also the overall quality and sustainability of that revenue.

Primary Responsibilities

- Monitor revenue performance across cities and restaurants.
 - Evaluate platform profitability.
 - Analyze refund and cancellation impact.
 - Monitor Average Order Value (AOV).
 - Support budgeting and financial planning.
 - Identify opportunities for cost optimization.
-

Primary KPIs

- Revenue Quality Score (RQS)
 - Weekly Revenue
 - Average Order Value (AOV)
 - Refund Rate
 - Cancellation Loss
 - Platform Fee Revenue
-

Key Business Questions

- Which cities generate the highest-quality revenue?
 - How much revenue is lost because of cancellations and refunds?
 - Which payment methods contribute most to business profitability?
 - How do promotional campaigns affect overall profitability?
 - Which operational issues have the greatest financial impact?
-

Decisions Supported

- Revenue optimization
- Budget allocation
- Pricing strategy
- Cost optimization
- Financial planning
- Profitability assessment

Primary Weekly Deliverables

- Weekly Revenue Summary
- Revenue Quality Report
- Cancellation Impact Report
- Refund Analysis Report
- Profitability Analysis Report
- Financial Performance Dashboard

Dashboard View

The Finance dashboard presents revenue trends, profitability analysis, Average Order Value, refund impact, cancellation costs, payment method insights, and financial recommendations to support sustainable business growth.

8.7 Customer Experience Team

Business Role

The Customer Experience Team is responsible for continuously improving customer satisfaction by monitoring service quality, identifying recurring customer issues, analyzing complaints, and ensuring that customer feedback is translated into meaningful operational improvements. The team plays a critical role in maintaining long-term customer trust and loyalty.

Primary Responsibilities

- Monitor customer satisfaction.
 - Analyze customer complaints.
 - Improve overall service quality.
 - Identify recurring customer pain points.
 - Evaluate customer feedback trends.
 - Support customer retention initiatives.
-

Primary KPIs

- Customer Satisfaction Rating
 - Complaint Rate
 - Recommendation Rate
 - Delivery Rating
 - Customer Loyalty Score (CLS)
-

Key Business Questions

- Which issues generate the highest customer dissatisfaction?
 - How do delayed deliveries affect customer loyalty?
 - Which restaurants generate the highest complaint rates?
 - Which delivery zones experience the poorest customer experience?
 - What operational improvements can increase customer satisfaction?
-

Decisions Supported

- Complaint resolution strategy
 - Customer service improvements
 - Service recovery initiatives
 - Customer experience optimization
 - Operational quality improvements
-

Primary Weekly Deliverables

- Customer Satisfaction Report
 - Complaint Analysis Report
 - Rating Trend Report
 - Service Quality Assessment
 - Customer Experience Insights
 - Service Improvement Recommendations
-

Dashboard View

The Customer Experience dashboard focuses on customer satisfaction trends, complaint analysis, delivery ratings, restaurant feedback, customer sentiment, and recommendations aimed at improving the overall customer journey.

8.8 Stakeholder Interaction Model

The Decision Intelligence Platform has been designed using a stakeholder-centric analytical framework in which every department receives insights specifically aligned with its operational responsibilities. Rather than providing a single generic reporting interface, the platform delivers customized KPIs, reports, alerts, and recommendations that enable each stakeholder to make informed business decisions.

Although each stakeholder monitors different business functions, all departments contribute collectively toward improving the organization's overall performance. Executive Leadership evaluates strategic business health, Operations focuses on delivery efficiency, Restaurant Success manages partner performance, Marketing strengthens customer loyalty, Finance ensures sustainable profitability, and Customer Experience enhances overall service quality.

The platform promotes cross-functional collaboration by ensuring that business insights generated for one department can be correlated with operational outcomes observed by another. For example, increasing delivery delays identified by the Operations Team may explain declining customer loyalty monitored by Marketing or increasing complaint rates observed by the Customer Experience Team. This integrated analytical approach enables stakeholders to identify root causes rather than isolated symptoms, supporting more effective and proactive decision-making.

Ultimately, the stakeholder interaction model establishes a unified Decision Intelligence ecosystem where business decisions are driven by interconnected operational insights rather than fragmented departmental reports.

9. Functional Requirements

9.1 Overview

The functional requirements define the core capabilities that the Decision Intelligence Platform must provide to support business operations, stakeholder reporting, and data-driven decision-making. These requirements describe **what the platform must accomplish** rather than how it will be technically implemented.

The platform has been designed to transform operational data into meaningful business intelligence by supporting multiple stakeholders through role-specific analytics, KPI monitoring, business alerts, and executive reporting.

9.2 Data Management

The platform shall:

- Store operational data related to customers, restaurants, riders, orders, payments, deliveries, weather, traffic conditions, and promotional campaigns.
- Maintain referential integrity between all business entities.
- Support historical business data for trend analysis.
- Organize information using a normalized relational database schema.

9.3 Business Intelligence

The platform shall:

- Calculate stakeholder-specific KPIs.
 - Generate weekly business summaries.
 - Monitor operational performance across cities and delivery zones.
 - Measure customer loyalty and restaurant performance.
 - Evaluate rider productivity and workload.
 - Analyze revenue quality and operational profitability.
-

9.4 Reporting & Analytics

The platform shall:

- Generate weekly executive reports.
 - Provide stakeholder-specific dashboards.
 - Identify operational bottlenecks.
 - Compare business performance across multiple cities.
 - Analyze trends over time.
 - Support drill-down analysis from executive-level KPIs to operational details.
-

9.5 Decision Support

The platform shall:

- Generate business alerts when KPIs fall below defined thresholds.
 - Recommend corrective actions based on analytical findings.
 - Support weekly management reviews.
 - Provide operational recommendations for continuous improvement.
-

9.6 Performance Monitoring

The platform shall:

- Monitor operational performance through periodic KPI evaluation.
 - Track delivery efficiency.
 - Evaluate restaurant consistency.
 - Measure customer satisfaction.
 - Monitor financial performance.
 - Compare business performance across stakeholder groups.
-

10. Non-Functional Requirements

10.1 Overview

Non-functional requirements define the quality attributes expected from the Decision Intelligence Platform. These requirements ensure that the analytical solution remains reliable, maintainable, scalable, and suitable for business reporting while supporting future expansion.

10.2 Performance

- Analytical queries should execute efficiently on the designed dataset.
 - Dashboards should provide responsive user interaction.
 - Weekly reports should be generated without significant delay.
-

10.3 Scalability

The platform should support future expansion by allowing additional cities, restaurants, customers, riders, and business metrics to be incorporated without requiring major structural modifications to the database.

10.4 Reliability

The analytical platform shall maintain consistent KPI calculations by following standardized business rules and validated data relationships.

10.5 Maintainability

The database structure, SQL scripts, documentation, and dashboard components shall remain modular and well-documented to simplify future enhancements and maintenance.

10.6 Data Quality

The platform shall ensure:

- Consistent business rules.
- Referential integrity.
- Valid operational relationships.
- Realistic simulated business behaviour.
- Accurate KPI calculations.

10.7 Security

Since this project is intended for educational and portfolio purposes, personally identifiable customer information is excluded from the dataset. Sensitive business information is represented using simulated data only.

10.8 Usability

The platform shall provide intuitive stakeholder-specific dashboards that enable business users to interpret analytical insights without requiring technical knowledge of SQL or database systems.

11. Business Rules

11.1 Overview

The Decision Intelligence Platform is built upon a comprehensive set of business rules that simulate realistic operational behaviour within a modern food delivery organization. Rather than generating independent random records, these rules establish meaningful cause-and-effect relationships between customers, restaurants, riders, operational conditions, and financial outcomes.

These relationships ensure that analytical insights generated throughout the platform closely resemble real-world business scenarios.

11.2 Customer Behaviour Rules

- Prime members place orders more frequently than non-prime customers.
- Repeat customers generally exhibit higher customer loyalty scores.
- Student customers predominantly generate late-night demand.
- Corporate customers contribute significantly to weekday lunch orders.
- Families typically generate larger average order values during dinner hours.
- Higher customer satisfaction increases the probability of repeat purchases.
- Multiple poor delivery experiences reduce future ordering behaviour.
- Positive recovery experiences improve customer retention.

11.3 Restaurant Behaviour Rules

- Fast-food restaurants maintain shorter preparation times.
 - Fine-dining restaurants generally require longer preparation times while generating higher average order values.
 - Cloud kitchens demonstrate higher preparation efficiency.
 - Longer preparation times increase the probability of delivery delays.
 - Restaurants with consistently poor preparation times experience lower customer ratings.
 - High-performing restaurants maintain consistent operational performance over time.
-

11.4 Rider Behaviour Rules

- Experienced riders achieve better delivery efficiency.
- Rider fatigue increases with workload and continuous delivery assignments.
- Higher fatigue contributes to increased delivery delays.
- Vehicle type influences delivery efficiency under varying traffic conditions.
- Peak-hour operations require increased rider allocation.

11.5 Operational Rules

- Traffic congestion increases delivery duration.
- Rainfall and adverse weather increase expected delivery time.
- Longer delivery distances require longer expected delivery durations.
- Peak-hour demand increases rider utilization.
- Orders exceeding defined SLA thresholds increase complaint probability.
- Delivery zones demonstrate different operational characteristics based on demand patterns.

11.6 Customer Experience Rules

- Delayed deliveries negatively affect customer satisfaction.
- Customer complaints increase as preparation delays increase.
- Higher restaurant ratings positively influence repeat ordering behaviour.
- Service recovery initiatives improve customer retention.
- Consistent delivery performance improves customer recommendations.

11.7 Marketing Rules

- Festival campaigns increase overall order volume.
 - Promotional campaigns improve customer acquisition.
 - Effective campaigns improve Prime membership adoption.
 - Excessive discount dependency negatively affects revenue quality.
 - Loyal customers respond differently to promotions compared to new customers.
-

11.8 Financial Rules

- Revenue quality depends on cancellations, refunds, customer loyalty, and repeat purchases.
- Higher cancellation rates reduce platform profitability.
- Larger basket sizes improve Average Order Value.
- Platform fees vary according to order value and promotional discounts.
- Sustainable revenue is prioritized over temporary revenue spikes.

11.9 Executive Rules

- Organizational performance is evaluated through multiple integrated KPIs.
- Weekly business reviews serve as the primary decision-making cycle.
- Business alerts are generated before operational issues significantly impact organizational performance.
- Every KPI must support an actionable business recommendation.
- Executive dashboards prioritize business health over isolated operational metrics.

11.10 Business Assumptions

These are assumptions made while designing the simulated business environment.

Examples:

- All operational data represents a fictional organization.
- Business behaviour is based on realistic industry practices.
- Customer ordering patterns are intentionally designed to reflect different demographic segments.
- Weather and traffic conditions influence operational performance according to predefined business rules.
- KPI thresholds are established for analytical demonstration and may vary across real organizations.
- Weekly reporting is considered the primary business review cycle throughout the platform.
